#### DETAILED ACTION

Claims 1-19 are presented for examination.

## Claim Rejections - 35 USC § 102

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless -

(e) the invention was described in a patent granted on an application for patent by another filed in the United States before the invention thereof by the applicant for patent, or on an international applicat ion by another who has fulfilled the requirements of paragraphs (1), (2), and (4) of section 371(c) of this title before the invention thereof by the applicant for patent.

The changes made to 35 U.S.C. 102(e) by the American Inventors Protection Act of 1999 (AIPA) and the Intellectual Property and High Technology Technical Amendments Act of 2002 do not apply when the reference is a U.S. patent resulting directly or indirectly from an international application filed before November 29, 2000. Therefore, the prior art date of the reference is determined under 35 U.S.C. 102(e) prior to the amendment by the AIPA (pre-AIPA 35 U.S.C. 102(e)).

2. Claims 1-19 are rejected under 35 U.S.C. 102(e) as being anticipated by Connelly et al USPN (6594786).

Art Unit: 2153

As per claim 1, Connelly et al teach a system for providing realtime cluster configuration data within a clustered computer network comprising a plurality of clusters (fig. 1), comprising:

a primary node (node 1) in each cluster (cluster C, fig.1) wherein said primary node includes a primary repository manager (HA 20b) [col. 6, lines 23-38];

a secondary node (node 2) in each cluster wherein said secondary node includes a Secondary repository manager (HA 20c) [col. 6, lines 23-38]; and

wherein said secondary repository manager cooperates with said primary repository manager to maintain information at said secondary node consistent with information maintained at said primary node [availability data is stored on both monitored systems (e.g., servers 2, 4, and 6) and the HA Server 22. See col. 7, lines 16-19 and col. 5, lines 36-47].

As per claim 2, Connelly et al teach the system of claim 1, wherein said primary node further comprises a primary data repository (storage 8) and primary services (event monitoring service 40) [col. 8, lines 13-37].

As per claim 3, Connelly et al teach the system of claim 2, wherein said secondary node further comprises a secondary data repository (storage 10) and secondary services (event monitoring service 40) [col. 8, lines 13-37].

Art Unit: 2153

As per claim 4, Connelly et al teach the system of claim 1, further comprising:

at least one additional node in at least one cluster wherein said additional node includes a repository agent [fig. 2 and 3 col. 6, lines 39-51 and col. 8, lines 22-40].

As per claim 5, Connelly et al teach the system of claim 4, wherein said repository agent forwards all write/update requests to said primary repository manager [col. 7, lines 7-15 and 8, lines 22-45].

As per claim 6, Connelly et al teach the system of claim 4, wherein said repository agent includes a software cache of repository data, wherein said repository data may be quickly accessed by an application [col. 6, lines 39-59].

As per claim 7, Connelly et al teach the system of claim 1, wherein said primary repository manager manages the storage of repository data on a first computer-readable medium, the maintenance of repository data on memory, and the synchronization of repository updates [col. 9, lines 38 to col. 10, line 26].

As per claim 8, Connelly et al teach the system of claim 7 wherein said secondary repository manager manages the storage of repository data on a second computer-readable medium, and the

Art Unit: 2153

maintenance of repository data on memory [col. 9, lines 38 to col. 10, line 26].

As per claim 9, Connelly et al teach the system of claim 8 wherein the repository data in said secondary node is synchronously up-dated so as to remain consistent with the repository data of said first node [availability data is stored on both monitored systems (e.g., servers 2, 4, and 6) and the HA Server 22. See col. 7, lines 16-19 and col. 9, lines 38 to col. 10, line 26].

As per claim 10, Connelly et al teach the system of claim 8 wherein said first and second computer-readable mediums each include a disc [see fig. 1, storage 8 and 10].

As per claim 11, Connelly et al teach a method of providing realtime cluster configuration data within a clustered computer network comprising a plurality of clusters (fig. 1 and abstract), comprising the steps of:

choosing a primary node (node 1) in each cluster wherein said primary node includes a primary repository manager (HA 20b) [col. 6, lines 23-38];

choosing a secondary node (node 2) in each cluster wherein said secondary node includes a secondary repository manager (HA 20c) [col. 6, lines 23-38]; and

causing said secondary repository manager to cooperate with said primary repository manager to maintain information at said secondary node consistent with information maintained at said primary node [availability data is stored on both monitored systems (e.g., servers 2, 4, and 6) and the HA Server 22. See col. 7, lines 16-19 and col. 5, lines 36-47].

Page 6

As per claim 12, Connelly et al teach the method of claim 11, comprising the further step of:

providing a repository agent for each additional mode of each cluster, wherein the repository agent interfaces with the primary repository manager in its cluster [fig. 3 and col. 8, lines 13-37].

As per claim 13, Connelly et al teach the method of claim 11, comprising the further steps of:

sending write/update information from a client only to said primary repository manager [col. 9, lines 38 to col. 10, line 26];

causing said write/update information to be written in said primary repository manager and said secondary repository manager [col. 9, lines 38 to col. 10, line 26]; and

validating completion of the entry of said write/update information only when the information successfully is written in both said primary repository manager and said secondary

Art Unit: 2153

repository manager [col. 5, lines 36-47 and col. 15, lines 48 to col., line 10].

As per claim 14, this is a computer program product claim with similar limitations as claim 11 above. Therefore, it is rejected with the same rationale.

As per claim 15, Connelly et al teach a computer program product of claim 14, wherein the computer program product is adapted when run or a computer to effect the further steps of:

providing a repository agent for each additional node of each cluster, wherein the repository agent interfaces with the primary repository manager in its cluster [fig. 3 and col. 8, lines 13-37].

As per claim 16, Connelly et al teach the computer program product of claim 14, comprising the further steps of:

sending write/update information from a client only to said primary repository manager [col. 9, lines 38 to col. 10, line 26];

causing said write/update information to be written in said primary repository manager and said secondary repository manager [col. 9, lines 38 to col. 10, line 26]; and

validating completion of the entry of said write/update information only when the information successfully is written in both said primary repository manager and said secondary

Art Unit: 2153

repository manager [col. 5, lines 36-47 and col. 15, lines 48 to col., line 10]

As per claim 17, this is a computer program product means claim with similar limitations as claim 11 and 14 above. Therefore, it is rejected with the same rationale.

As per claim 18, Connelly et al teach the computer program product of claim 17, further comprising:

means for providing a repository agent for each additional mode of each cluster, wherein the repository agent interfaces with the primary repository manager in its cluster [fig. 3 and col. 8, lines 13-37].

As per claim 19, Connelly et al teach the computer program product of claim 17, further comprising:

means for sending write/update information from a client only to said primary repository manager [col. 9, lines 38 to col. 10, line 26];

means for causing said write/update information to be written in said primary repository manager and said secondary repository manager [col. 9, lines 38 to col. 10, line 26]; and

means for validating completion of the entry of said write/update information only when the information successfully is written in both said primary repository manager and said

Art Unit: 2153

secondary repository manager [col. 5, lines 36-47 and col. 15, lines 48 to col., line 10].

## Conclusion

The prior made of record and not relied upon is considered pertinent to applicant's disclosure.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Yasin Barqadle whose telephone number is 703-305-5971. The examiner can normally be reached on 9:00 AM to 5:30 PM.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Glenn Burgess can be reached on 703-305-4792. The fax phone numbers for the organization where this application or proceeding is assigned are 703-872-9306 for regular communications and 703-746-7238 for After Final communications.

Any inquiry of a general nature or relating to the status of this application or proceeding should be directed to the receptionist whose telephone number is 703-305-3900.
